

Unauthorized Digging Detection System for Archaeological Sites

Introduction

Sri Lanka's archaeological sites are vital cultural treasures but face threats from illegal digging and looting.

We propose an IoT-based smart monitoring system that uses sensors, RFID, and GSM alerts to detect and prevent unauthorized activities in real time.

Problem statement

- Archaeological sites are at risk from illegal digging, looting, and treasure hunting.
- Loss of artifacts, fossils, and ancient structures.

- Lack of real-time monitoring in remote heritage locations.

Proposed Smart Solution

- IoT-based Unauthorized Digging Detection System
- Combines vibration, sound, temperature, piezo sensors, GPS & RFID authentication.
- Real-time monitoring through Firebase + Website Dashboard.
- Instant alerts via GSM SMS to authorities.

Objectives

01 Continuous low-cost monitoring of archaeological sites.

02 Detect and alert unauthorized digging, tampering, fire, or GPS displacement.

03 RFID authentication for authorized personnel.

04 Cloud-based data logging and remote access.

Key Features

- Real-time sensor monitoring.
- RFID-based authorization.
- Data logging with Firebase.
- GSM SMS alerts for quick response.
- Fire detection & device tamper alerts.
- Web interface for live + historical data.

System Workflow

Initialization: NodeMCU connects to Wi-Fi & Firebase.

Authorized Access: RFID scan
→ Site safe for digging.

Unauthorized Activity:

- Vibration + Sound detected
- Fire via Temperature Sensor
- GPS movement / Tampering
- No RFID validation
- → GSM Alert to Security Authorities

Real-World Applications

Archaeological Site
Monitoring

Forest & Heritage
Protection Zones

Historical Monument
Surveillance

Mining Area Border
Control

Environmental Site
Monitoring

Challenges in Sri Lanka

- ✓ Network coverage issues in rural archaeological zones
- ✓ High cost of large-scale deployment.
- ✓ Maintenance in harsh weather conditions.
- ✓ Limited awareness & adoption by local authorities.
